Core-

Core-CT 9.1 enables agencies to take physical inventories that include both capitalized and noncapitalized assets. In order to include non-capitalized assets in a physical inventory, users must set up Extract IDs and Scan Scope IDs for non-capitalized assets. These extract IDs and scan scope IDs work like the extract IDs and scan scope IDs used for capitalized assets. The extract IDs define which assets are included in the extract. The scan scopes define the physical locations that are included.

Non-Capitalized Extract IDs and Non-Capitalized Scan Scope IDs are based on pre-defined Mass Change Templates:

- PI NCP Extract for the extract ID
- PI NCP Scan Scope for the scan-scope ID

In addition to selecting Capital Extract IDs and Capital Scan IDs when defining a physical Inventory Occurrence, users must also select the appropriate Non Capital Extract ID and Non Capital Scan Scope ID on the **Definition** page.

Click the **View All** link on the **SQL Statement** bar.

Select Between Value A and Value B in the **Location Code to extract from** drop down for Execution Seq 1 and 2.

Select the locations to be included in the extract using the Field Value section for each **Execution Seq**. Use the **Plus** button to add a new row. Select the first location in the top row in each section and the last location (by numeric value) in the second row. Core-CT will include all locations between these two values in the extract. The location range for each **Execution Seq** should be the same.

Execution Seq 1 includes all non-capitalized assets with a location included in the range of locations selected.

Execution Seq 2 includes any physical assets with locations included within the selected range of locations. Physical Assets are assets that have been added to the system based on purchase order/receiver

information. Voucher information for these assets has not yet been added to the asset tables. These assets have the status of "received, not in service".

Click the **Generate SLQ** tab.

Click the Save button.

Non-Capitalized Scan ID

The steps used to create a non-capitalized Scan ID are nearly identical to those used to create a non-capitalized Extract ID. There are two differences. First, the mass change template used is different—PI NCP Scan Scope rather than PI NCP Extract. Second, the range of locations included in **Execution Seq** 1 and 2 will often be smaller than that used for the extract ID.

The scan scope reflects the locations to be included in the physical inventory counts and the extract includes all assets in all locations associated with a Business Unit.
